

CI/CD

Keep Business Running

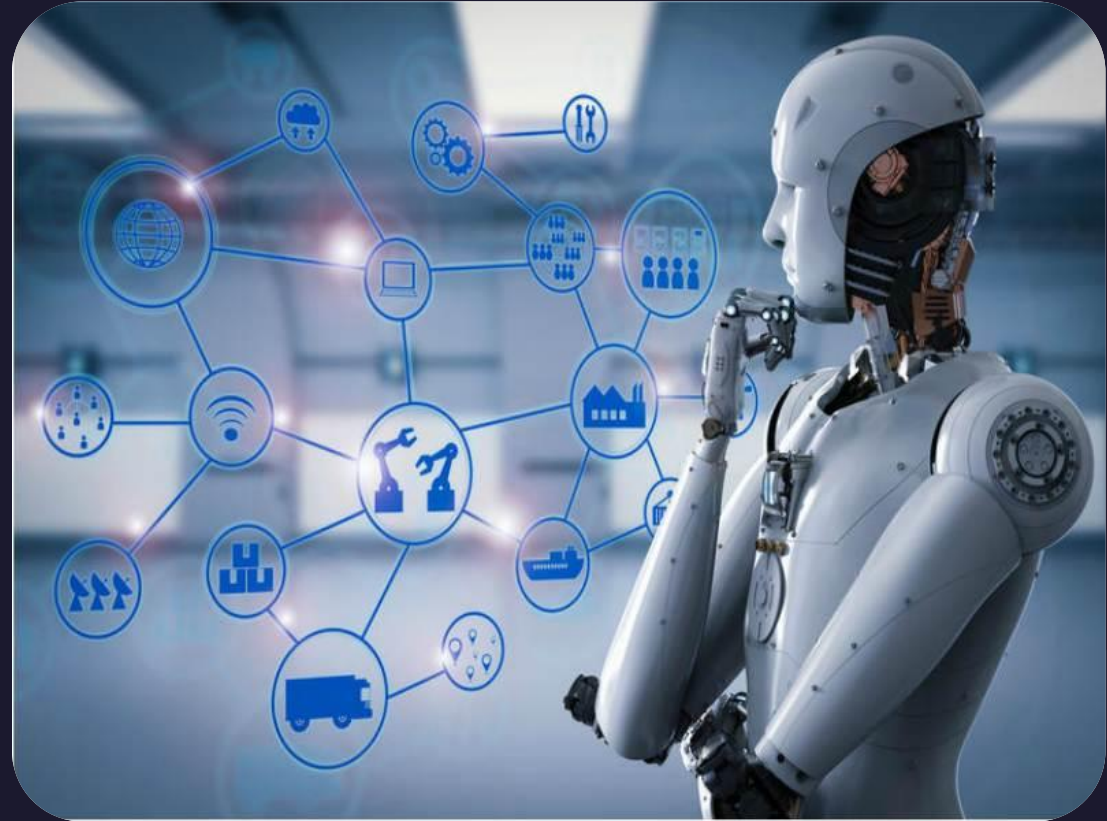

Continuous Integration

- Is a software development strategy that increases the speed of development while ensuring the quality of the code that teams deploy. It helps to split the code into small increments that are tested continuously and integrated to code when successfully passes test. Which increase quality and speed of detecting problems before getting to operation.

Continuous Deployment & Delivery

Each year, businesses lose money because of projects that do not meet business needs where deadlines are missed, issues arise in production, etc. But anytime a human does not have to intervene in the software development process, time, and thus money, are saved.

CI/CD Benefits

1. **Bring Products to Market Faster**
2. **Maximum consumer demand satisfaction**
3. **Increase revenue by time**
4. **Accurate progress monitoring**
5. **Rapid feedback cycle**

Organizations that have effectively implemented CI/CD can bring new products and features to market faster and immediately start generating revenue from the features they deploy rather than waiting for the entire app to be completed (and checked manually) before they can launch.
